No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                         631

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the modified PAO pilin protein from P.aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native P.aeruginosa. Modified pilin proteins are that effect the desired deletion of pilin coding sequences using primers coil moiety in the coding sequences. The modified protein thus lacks a pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.
                                                                                                                                                                                                                                                                                                                                                                                              AAY44385
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
```

region

Phe present sequence is the H coil truncated PAO pilin protein from p, aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil homodimer with an identical peptide segment which can form dimeric mobilisation of host-cell receptor sites inflammatory due to reduced degree of of pilin protein necessary for attachment to the host cell during informing the modifical and incomparation of host-cell receptor sites. This prevents oligomerisation of host-cell receptor sites. This prevents oligomerisation of host-cell receptor sites in the host cell during the modifical sites and the host cell during the modifical sites are the sites and the host cell during the modifical sites are the sites and the host cell during the sites are the si

modified pilin protein is useful

                                                                        The present sequence is the modified PAK pilin protein from r. aeruginosa. The N-terminal peptide region preferably lacks the first 15-40 residues of native p.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil moiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY44376 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                        The present sequence encodes E coil truncated PAK pilin protein from Paeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil heterodimer with an oppositely charged peptide segment which can form dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents
                                                                                                                        oligomerisation of pilin protein necessary for attachment to the host cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition for treating or preventing Pseudomonas aeruginosa infection comprising pilin protein that can not self-assemble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modified PAK pilin protein; alpha-helical forming portion; E coil; Exemplary coil; coiled coil heterodimer; host cell-receptor site; Pseudomonas infection; cystic fibrosis; neutropenia.

                                                                                                                                                                                  The present sequence is the H coil truncated PAK pilin protein from P.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil structures. These proteins are less inflammatory due to reduced degree of pilin protein necessary for attachment to the host cell during prophylaxis for individuals at risk of Pseudomonas infection, the modified pilin protein is useful in treatment and e.g. Cystic fibrosis patients, burn patients, and severe neutropenic

The N-terminal peptide region preferably lacks the first prepared by pcR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled coil motery in the coding sequences. The modified protein thus lacks a pilin protein necessary for attachment to the host cell during infection of lighted plasmid DNA was transformed into an expression host. The modified pilin protein is useful in treatment and prophylaxis for modified pilin protein is useful in treatment and prophylaxis for patients, burn patients, and severe neutropenic patients.

The N-terminal peptide region preferably lacks the first 15-40 residues of native p.aeruginosa. Modified pilin proteins are prepared by PCR amplification of pilin coding sequences using primers that effect the desired deletion, modification or insertion of a coiled-coil moiety in the coding sequences. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The ligated plasmid DNA was transformed into an expression host. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Composition for treating or preventing Pseudomonas aeruginosa infection comprising pilln protein that can not self-assemble - \,

Composition for treating comprising pilin protein 

Claim 9; Fig 1A; 32pp; English.

The present sequence is the modified K122 pilin protein from P. aeruginosa. The N-terminal 1-28 residues are deleted from K122 strain pilin protein. The modified protein thus lacks a critical alpha-helical forming portion. This prevents oligomerisation of pilin protein necessary for attachment to the host cell during infection. The first five amino acid residues are not native to the K122 sequence, but are derived from an intrinsic coding sequence of the expression vector. The C-terminal residue is the Pro residue immediately upstream of the stop OCH codons. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic patients.

                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of a submolecular unit of Pseudomonas aeruginosa pilin protein which corresponds to at least one epitope common to structural pilin proteins of Type IV piliated bacteria. It is capable of eliciting antibodies (Abs) which bind to whole pili of type IV bacteria. The ability of the submolecular unit to produce Abs which bind to whole pili provides the basis for vaccines against type IV bacterial infections, e.g. footrot infection in ruminants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes E coil truncated K122 pilin protein from P.aeruginosa. The first 15-40 residues of the N-terminal peptide region is replaced by a peptide segment capable of forming a coiled-coil dimeric structures. These proteins are less inflammatory due to reduced degree of mobilisation of host-cell receptor sites. This prevents cell during infection. The modified pilin protein is useful in treatment and prophylaxis for individuals at risk of Pseudomonas infection, e.g. cystic fibrosis patients, burn patients, and severe neutropenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

The sequences given in AAR86702-08 are peptides which have the same immunoreactivity as the peptide sequence given in AAR86701. These peptides are derived from the P. aeruginosa pilin protein. The peptide of the invention is derived from the excenzyme, ExoS is an enzymatic/cytotoxic protein present on the surface of P. aeruginosa cells. It is also an adhesin. It demonstrates immunospecific binding to monoclonal antibodies PK99H and MCA1. The ExoS derived peptide has the ability to block binding of P. aeruginosa to buccal epithelial cells by blocking a cell surface receptor. It is homologous to known adhesion domains in the P. aeruginosa pilin protein, esp. the region 131-143. These peptides may be used in vaccines to provide active immunisation against infection by P. aeruginosa or related organisms. They can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is the C-terminal amino acid sequence of pilin from the P.aeruginosa strain PAO, one of 10 strains which were investigated. The PAO peptide is classified in a group with C-terminal peptides containing 14 residues from Cys to Cys and is cross-reactive with surface peptides in certain bacteria and fungi. The peptides bind specifically to pulmonary epithelial cells. See also AAR25828 and AAR25901-R25908.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides a peptide vaccine against P. aeruginosa that comprises a pilin peptide conjugated to a carrier profesin. The pilin peptide has one of the four sequences selected from AAY49352-355. The vaccine is used to prevent Pseudomonas infections. The present sequences represents a native fragment of pilin peptide from P. aeruginosa stransports.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vaccine; P. aeruginosa; pilin; Pseudomonas infection; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              P. aeruginosa PAO pilin peptide native sequence
